LeDoux, BA; Danielle Britt, MA, Pharm D; Heidi-Ramp Rogers; Matthew Tanner, Pharm D, BCPS; Andrea Moye, RN, BSN; Janelle Williams, RN, BSN; Michelle Watson, RN, BSN; Mai Dotran, RN, BSN.

Background

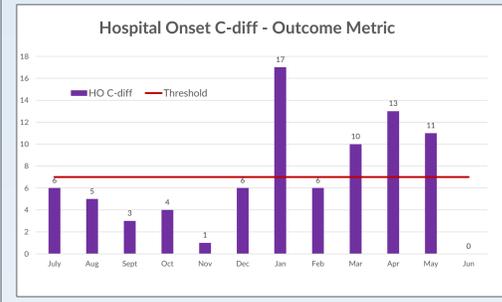

Problem:

Increased Hospital-Onset (HO) *C. difficile* cases; 92 cases in 2016 (Year 1)

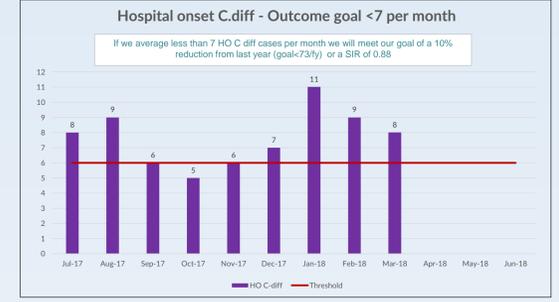

Results

Data July 2016 – June 2017

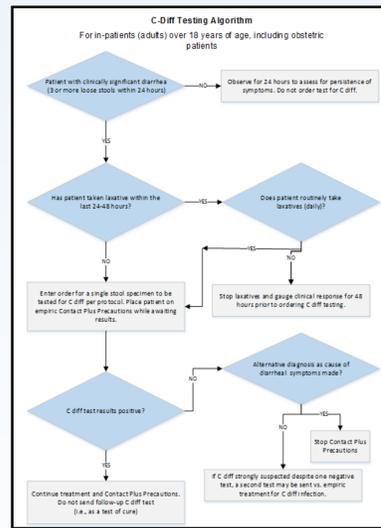

After Year 1, saw a 10% reduction or a Standardized Infection Rate (SIR) of 0.983. Could additional interventions from the *C. diff* guidelines further improve rates? A new target of 73 cases (SIR of 0.89) was set for fiscal year 2018.

Data July 2017 – March 2018

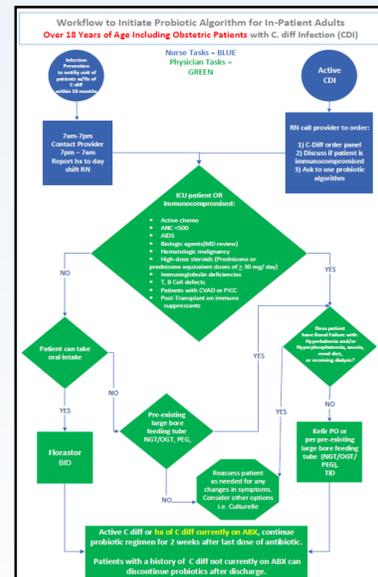

Tests of Change (TOC) Implemented

C. diff Algorithm for testing within 24 hours

Standard Contact Plus Signage Developed

Probiotics Algorithm

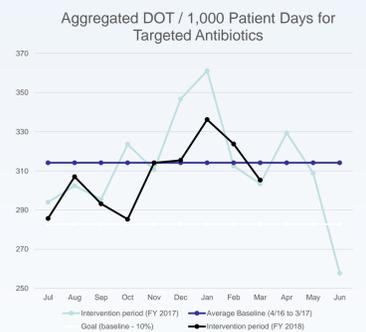

Patient Room Cleaning Standardization

Oxycide Sporicidal Cleaner

Hand Hygiene

Proton-Pump Inhibitor Required Indication to Decrease Use

Antimicrobial Stewardship Program

Conclusion

Tests of change are currently in implementation to reduce Hospital Onset *C. diff* infections. Work will continue with our Antimicrobial Stewardship program to reduce the use of broad spectrum antibiotics.

Research has shown that reducing use of broad spectrum antibiotics will decrease both antimicrobial resistance and *C. diff* rates. We will also continue our focus on hand hygiene as healthcare workers are the biggest contributor to HAIs.
